Pachyderm Code Changes

ISSUE: Image links to external sites and files such as PDFs open in the Pachyderm presentation window/tab rather than opening in a new window/tab.

MORE INFO: The little icons work properly and open the external link in a new window/tab but the larger thumbnail images will open the linked item in the same window/tab, replacing the Pachyderm presentation.

FIX: edit **widget.mainMedia.js**
location: /lib/js/pachyderm/widget.mainMedia.js

line 210: add ***target=_blank*** to the media-asset-container

UPDATE-JAN 2014: Further use of Pachyderm has shown that the above is not the best solution. If an image was used to link to an internal page of the presentation, the Pachyderm page page will open in a new window using the above fix.

A refinement of the above is to use the below. This update checks first to see if the link is an internal one or external. If an external URL, it adds the "target=_blank" to the link to open a new window/tab.

REPLACE (code is located starting at about line 209):

```
if(this.linkURL){
        markup = '<div class="media-asset-container image-only"><a href="'+this.linkURL+'"><img src="' + this.imageFileName + '"
alt=""/></a></div>';
}else{
        markup = '<div class="media-asset-container image-only"><img src="' + this.imageFileName + '" alt=""/></div>';
}
```

WITH THIS:

```
if(this.linkType == 'internal'){
        markup = '<div class="media-asset-container image-only"><a href="'+this.linkURL+'"><img src="' + this.imageFileName + '"
alt=""/></a></div>';
}else if(this.linkType == 'external'){
        markup = '<div class="media-asset-container image-only"><a href="'+this.linkURL+'" target=_blank><img src="' + this.imageFileName + '"
alt=""/></a></div>';
}else{
        markup = '<div class="media-asset-container image-only"><img src="' + this.imageFileName + '" alt=""/></div>';
}
```
